Computed Tomography

Dose descriptors from CT scan

- Computed Tomography Dose Index (CTDI)₁₀₀
 - 100-mm long ion chamber measurement for a single axial rotation
- $CTDI_w = \frac{1}{3} CTDI_{100,center} + \frac{2}{3} CTDI_{100,peripheral}$

Dose descriptors from CT scan

$$DLP = CTDI_{vol} \times l = \frac{CTDI_w}{pitch} \times l = \frac{nCTDI_w \times mAs}{pitch} \times l$$

I. Dosimetry for UK-NCI CT Cohort Study

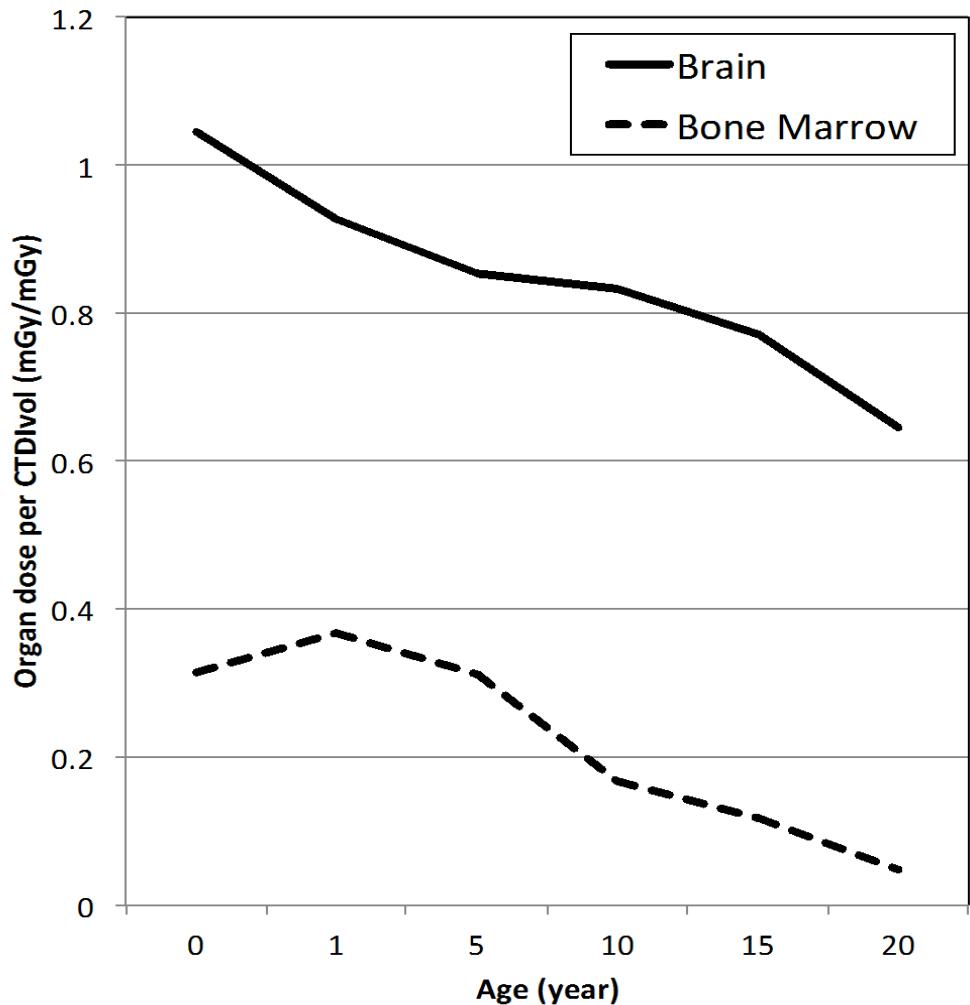

- Retrospective epidemiological cohort study*
 - 180,000 pediatric and young adults (< 22 years) in the UK
 - CT scans performed 1985 – 2002
 - With no prior history of malignancy
- Organ dosimetry for the cohort**
 - Patient age, sex, scan region, and scan year collected
 - Scanner parameters from 1989 and 2003 UK survey data
 - Brain and bone marrow doses calculated by NCICCT

*Pearce, Little ... Lee ... Berrington *The Lancet* 2012

**Kim et al. *Rad Prot Dosim* 2012

Example dose calculated for head CT

- Brain and bone marrow dose normalized by scanner output
- Newborn receives 1.6× and 6.5× greater brain and marrow doses than adult, respectively.
- Newborn brain dose is 3.6x greater than the newborn bone marrow.

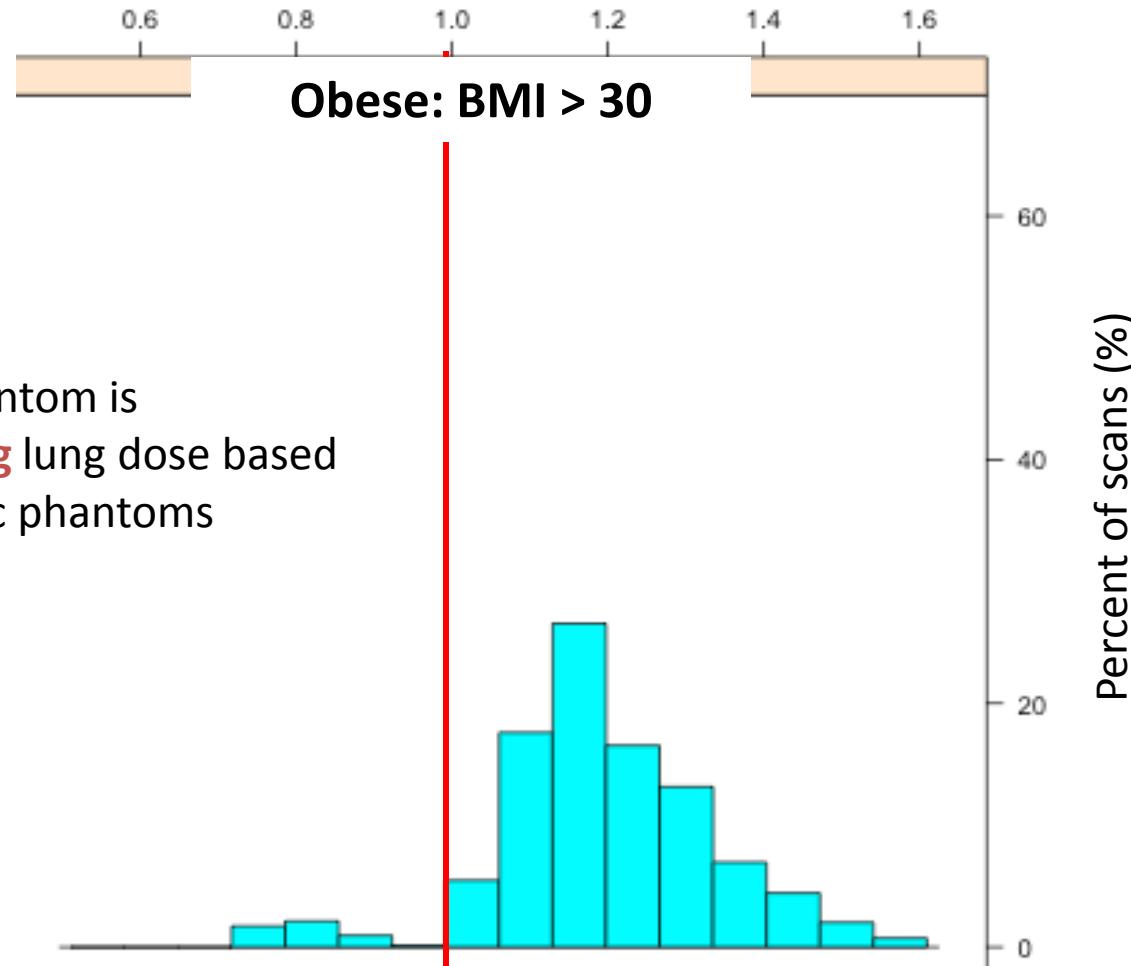

II. Dosimetry for National Lung Screening Trial

Collaborators: NLST Physics Group

- National Lung Screening Trial (NLST)
 - Compares two ways of detecting lung cancer: CT vs. chest x-ray
 - 53,454 current or former heavy smokers (ages 55 – 74)
 - Found that CT screening will reduce lung cancer mortality 15-20% more than chest X-rays*
- 23,773 CT scans (body size available) identified.
- Patient ID, gender, height, weight, scan length, kVp, mAs, and CTDI_{vol} were collected from DICOM data
- Calculate organ doses using NCICT-X

Results: Lung dose comparison

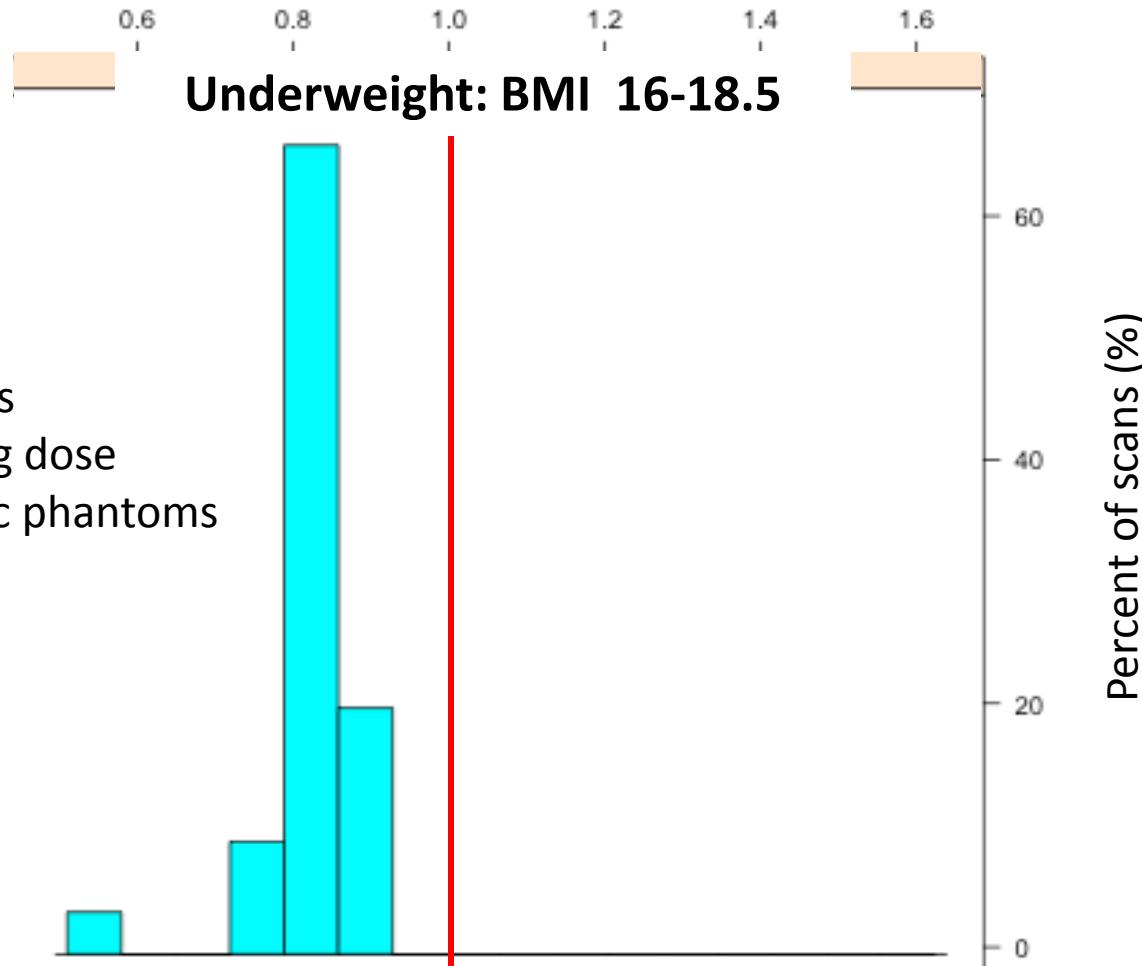

Ratio of lung doses from reference phantoms to those from size-specific

Reference phantom is
overestimating lung dose based
on size-specific phantoms

Results: Lung dose comparison

Ratio of lung doses from reference phantoms to those from size-specific

Reference phantom is
underestimating lung dose

On-time dose calculations

- Semi-automatic contouring of 8 different structures took less than 30 minutes per patient.

| Organ volume (cm ³) | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|---------------------------------|------|------|------|------|------|------|------|------|
| Liver | 2098 | 1244 | 1412 | 1356 | 1283 | 1833 | 1433 | 1260 |
| Kidneys | 165 | 152 | 179 | 150 | 123 | 182 | 146 | 138 |
| Spleen | 346 | 175 | 135 | 137 | 211 | 255 | 230 | 157 |
| Pancreas | 96 | 47 | 63 | 58 | 56 | 74 | 46 | 51 |

Methods

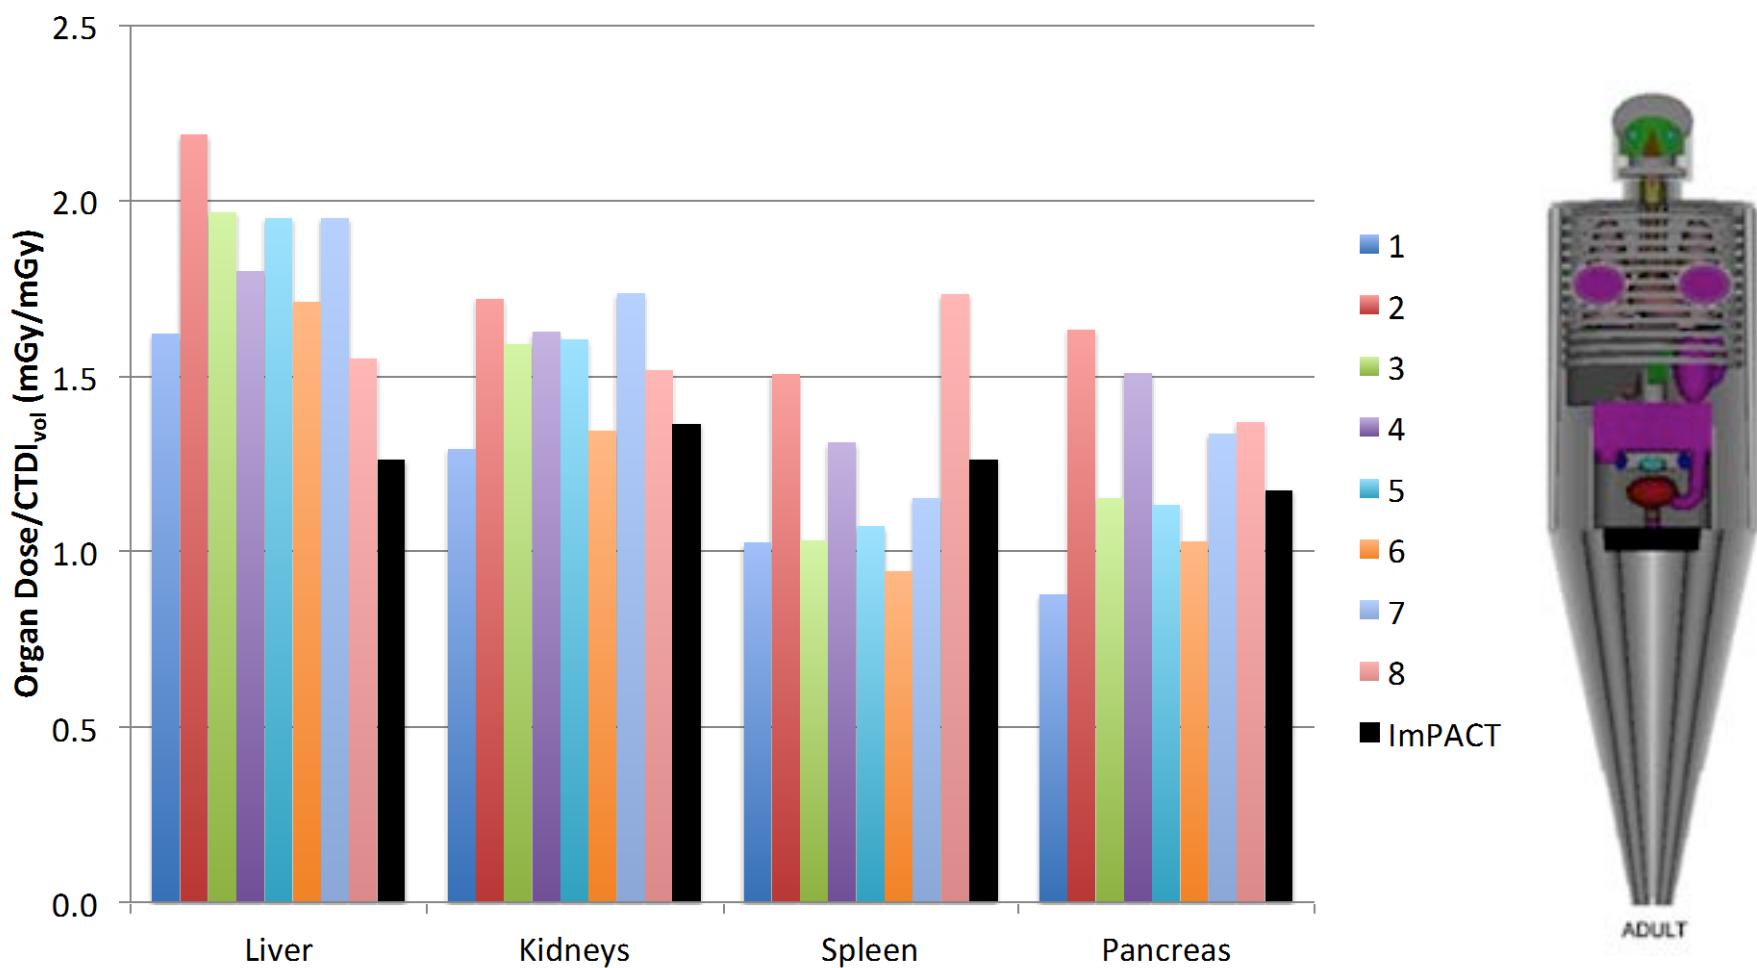

- Scan parameters were automatically abstracted from DICOM headers by using an in-house script.
- Scanner make and model, average mAs, and pitch were used to derive patient-specific CTDI_{vol}.*
- Abstracted parameters
 - 5 Siemens / 3 Phillips scanners
 - 24 – 29 cm scan length
 - 120 kVp
 - 171 – 330 average mAs
 - Pitch 0.8 – 1.08

Results

- The whole process (organ contouring, CT parameter abstraction, and Monte Carlo calculations) took less than an hour per patient.
- Maximum organ doses are up to 3-times (spleen, pancreas) greater than minimum organ doses.
- The dose variation across the patients is majorly attributed to different mAs, locations of organs, and patient body sizes.

Results

- Organ dose normalized to CTDI_{vol} (mGy/mGy) vs. ImPACT

Which of the following parameters have the least impact on lung doses in a chest CT scan?

1. Tube current-time product (mAs)
2. Tube potential (kVp)
3. Patient weight
4. Patient height (answer)

Quiz #2

If you want to calculate thyroid dose in a chest CT scan, which of the following information would be most useful?

1. CT scanner manufacturer
2. CT scanner model
3. CTDI_{vol}
4. Tube potential (kVp)
